Space

From the moment that man first walked on the moon, the space industry has led the way. Software-based space systems have enabled great things.

On a global scale, for example **positioning and using satellite systems** to accurately monitor the planet's health. **Monitoring carbon emissions** and ensuring that accurate weather forecasting becomes the norm. **Relaying information** to remote regions of the globe to educate the masses or assist with relief aid in disaster areas.

And on a local scale, helping people to precisely navigate their way around a city, or around the world.

What makes it all the more amazing is that it's done with just a click of the mouse. The power to quite literally open up new communication channels throughout the world or search for life beyond the earth is in your hands.

How have we arrived at this point? With your help of course. We've sat down together with you and developed space-age software solutions that are:

- Secure, especially when dealing with satellite communications
- Able to cope in all complex technical environments
- Proven to work first time, every time
- Ultra-reliable and maintenance free for ten years or more
- Delivered on time to avoid costly delays

Together we've shown that with the right solutions in place, **anything is possible.**
